Mobile Developpement Project

Pro-Link: Enterprise Internship & Skill Tracking

Pro-Link is a Flutter-based professional management app designed to bridge the gap between the university and the corporate world. It streamlines the internship process, allowing companies to track student progress, manage corporate IDs, and evaluate professional skills in a centralized environment.
Actors (Single application, unified login page)

- **Admins (HR/University Coordinators):** Manage interns, validate corporate registrations, assign interns to specific corporate mentors/departments, and upload office schedules or policy handbooks.
- **Mentors (Professional Supervisors/Teachers):** Evaluate intern performance (marking), upload training modules/resources, and track weekly attendance for their assigned groups.
- **Interns (Students):** Must register and await admin validation. Once approved, they can view their Digital Work ID, check their shift schedules, access training files, and view their professional skill evaluations (marks).

Project Sprints & Evaluation

Sprint 1: Front end and UI (3 points)

- **Professional Interface:** Design a clean, corporate-style UI for all three actors.
- **Digital Employee Card:** Design a sleek "Work ID" for interns containing their photo and department information.
- **Unified Access:** Build a professional login page and dedicated home dashboards for Admin, Mentor, and Intern.

Sprint 2: Functions (2.5 points)

- **Management Panel:** Admins must be able to assign interns to departments and mentors, and upload office timetables.
- **Intern Dashboard:** Pages for interns to view their department assignments, skill marks, schedules, and training documents.

- **Mentor Tools:** Interfaces for supervisors to manage their intern groups, upload training files, and update performance marks.

Sprint 3: Backend (2.5 points)

- **Authentication:** Register users in the database with a secure login/signup process.
- **Data Handling:** Save and fetch all corporate data from the database.
- **Server Integration:** Enable data modification and image/file uploads (e.g., reports or ID photos) to the server.
- **Technical Note:** Using a REST API SQL connection is highly recommended and will be better marked.

Sprint 4: Search & Optimization (1 point)

- **Predictive Search:** A search bar with suggestions to help users quickly find training modules, intern records, or company policies.
- **Responsive Design:** Ensure the professional UI adapts perfectly to various screen sizes.

Technical Guidelines

- **Framework:** Flutter must be used for the entire application.
- **Database:** You may use Firebase, NoSQL, or SQL; however, **SQLite is strictly forbidden**.
- **Grading:** This project accounts for **11/20** of the total TP mark. Sprints 1 and 2 are mandatory for a minimum mark.
- **Creativity (2 Marks):** Additional points are awarded for UI design, creativity, and the integration of extra APIs (e.g., push notifications for deadlines or calendar integration).

The project is to be returned after vacation and before exams, exact date will be sent later but probably one-two weeks before the end of the semester.
Feel free to email me your concerns if you have any.
Each project should contain no more than Three (3) students; all students should be present during the project's consultation.
Students can be from different groups.
